

BACKED BY SCIENCE

There are many fake and ineffective devices.

There are many devices that claim to kill germs and viruses with UVC light. However, many are ineffective, or even fake. Roman Engel-Herbert, Penn State associate professor of materials science, physics and chemistry, said: “You have to ensure a sufficient UV light dose to kill all the viruses. This means you need a high-performance UV LED emitting a high intensity of UV light, which is currently limited by the transparent electrode material being used.”
